Integers in Python

BEGINNER LESSON | Qspiders | Python 3

Learning goals: Recognize whole numbers, use integers, and check their type.

1. What is an integer?

An integer is a whole number without a decimal point. It can be positive, negative, or zero. Python calls this type `int`.

2. Create and use

Use integers for values such as age, number of students, or a score.

```
age = 18
score = -5
print(age)    # Output: 18
print(score)  # Output: -5
```

3. Check the type

Use `type()` to find a value's data type.

```
print(type(age))  # Output: <class 'int'>
```

4. Key points

- `10`, `-10`, and `0` are integers.

- Write numbers without quotes: `18` is an integer; `"18"` is text.

- `18.0` is a float because it is written with a decimal point.

5. Try it yourself

Create `students` with the value `30`. Print its value and its type.
